NetWatch

Campus Network Threat Visibility

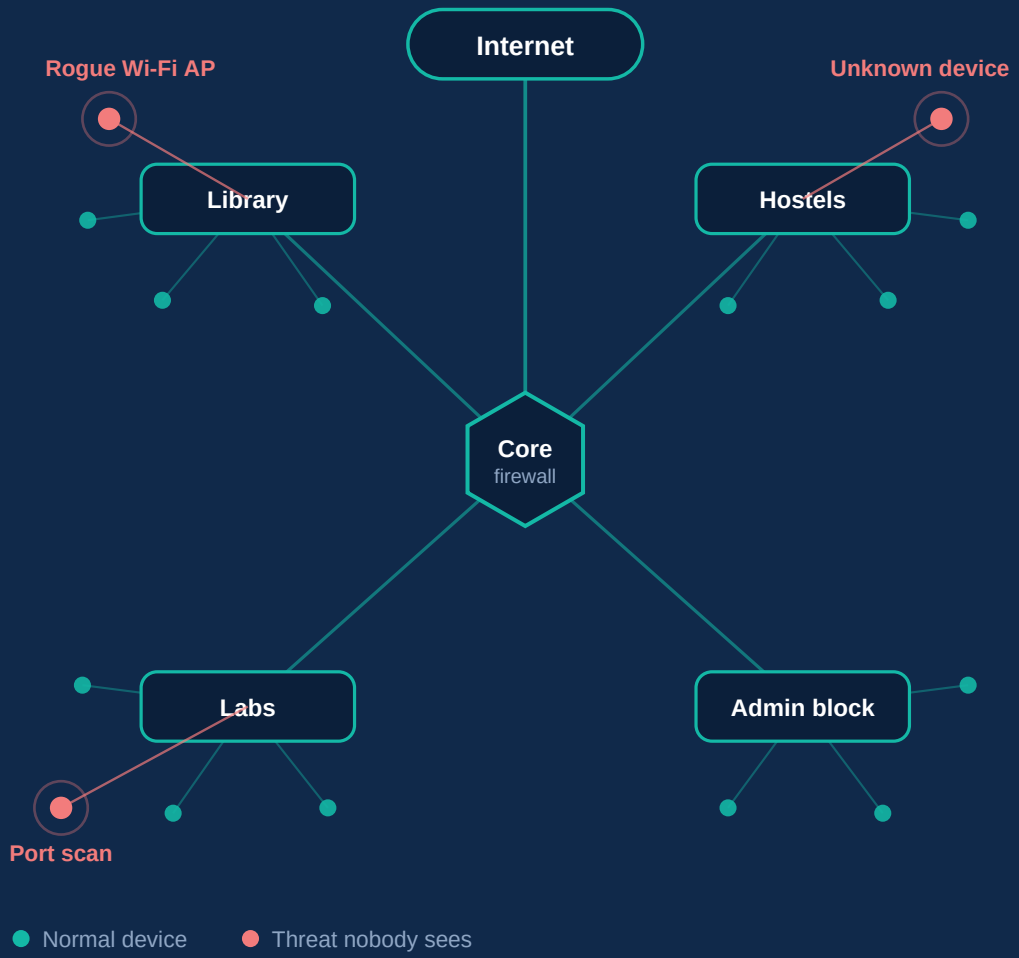
OVERVIEW

NetWatch is a network security monitoring platform built for campuses. It gives IT teams a clear, real-time view of everything happening on the network: which devices are connected, how traffic is behaving, and where something looks wrong. By detecting suspicious activity such as unknown devices, abnormal traffic spikes and scanning attempts, and surfacing it through a simple dashboard with instant alerts, NetWatch helps teams spot and stop threats before they disrupt students, staff and research.

The Problem

Why campus networks are hard to protect

A typical campus network



1 Open, crowded networks

Thousands of personal phones, laptops and IoT devices join the network every day, and most are unmanaged.

2 Little visibility

IT teams often cannot see who is connected or what traffic is normal, so threats blend into the noise.

3 Slow detection

Problems such as malware spread, port scans or data misuse are usually found only after users complain.

4 Small teams, tight budgets

Enterprise security tools are expensive and complex, which puts them out of reach for most campuses.

Our Solution

How NetWatch turns raw network activity into clear insight

STEP 1

Collect

Gathers traffic and device activity from campus network points.

STEP 2

Analyse

Builds a baseline of normal behaviour for devices and traffic.

STEP 3

Detect

Flags unknown devices, unusual spikes and scanning patterns.

STEP 4

Alert

Shows everything on a live dashboard and notifies the IT team.

The idea in one line

One simple view of the whole campus network, so threats are seen early and handled fast.

Key Features

What NetWatch offers

Live traffic dashboard

Real-time charts of bandwidth, top talkers and activity by area.

Device discovery

Automatic inventory of every connected device, with new ones highlighted.

Anomaly detection

Spots behaviour that departs from the normal baseline.

Instant alerts

Notifies the IT team the moment suspicious activity is found.

Incident log and reports

Keeps a searchable history of events for review and audits.

Lightweight and low cost

Built with open tools so campuses can run it without heavy spending.

Impact and Roadmap

The value NetWatch delivers and how we will build it

Expected impact

- Faster detection and response to threats
- Full awareness of devices on the network
- Safer access for students, staff and research
- Less manual monitoring work for IT teams
- An affordable option for any campus

Build roadmap

1. **PHASE 1**
   Traffic collector and basic dashboard
2. **PHASE 2**
   Device discovery and detection rules
3. **PHASE 3**
   Alerts, incident log and reports
4. **PHASE 4**
   Pilot test on the campus network

Thank You
